

Account Access & Password Management

Category: Account Access | KB-ACC-001 | v3.3 | Last Updated: Feb 2026

1. Password Reset -- Email Delivery

Password reset emails are sent from no-reply@nextiva.com with the subject line "Reset your Nextiva password." They typically arrive within 60 seconds.

If the reset email hasn't arrived

- Check Spam/Junk folder -- automated emails are frequently filtered there
- Gmail users: check the Promotions tab (this is the #1 reason for missing reset emails)
- Outlook users: check the Focused/Other or Clutter tabs
- The reset email goes to whichever email is registered on the account, which may be different from the email the customer expects
- Whitelisting no-reply@nextiva.com and notifications@nextiva.com prevents future filtering

Reset link details

- Valid for 24 hours from the time it was generated
- Single-use: once a new password is set, the link cannot be reused
- Maximum 5 reset requests per hour per account
- Each new request invalidates all previous unused links

AGENT PROCESS (internal -- not customer-facing)

Self-service path: Login page > Forgot Password > Enter email > Send Reset Link

Agent-triggered: Admin Console > Users > Search user > Security tab > Send Reset Link

2. Updating the Registered Email Address

When a customer no longer has access to their registered email (e.g., company rebrand, job change, email provider switch), we can update the email on their account after a quick identity check.

What the customer needs to provide

The customer provides any 2 of the following to verify their identity:

1. Last 4 digits of the payment card on the account
2. Billing zip code
3. Approximate account creation date (month and year is enough)
4. Phone number on file
5. Answer to their security question (if they set one up during signup)

What happens after verification

Once identity is confirmed, the email is updated immediately. A confirmation email is sent to the new address -- the customer clicks the confirmation link, and then a password reset link can be sent to the new email. The confirmation email arrives within 60 seconds and comes from no-reply@nextiva.com with the subject "Confirm your email address."

AGENT PROCESS (internal -- not customer-facing)

Identity verification: must pass 2 of 5 factors. If verification fails, escalate to Security team (SLA: 24 hours).

Email update path: Admin Console > Users > [User] > Profile > Edit Email > Save.

After customer confirms: Admin Console > Users > [User] > Security > Send Reset Link.

3. Password Requirements

The new password must meet all of the following requirements:

- At least 12 characters long
- At least 1 uppercase letter (A-Z)
- At least 1 lowercase letter (a-z)
- At least 1 number (0-9)
- At least 1 special character (like !, @, #, \$, %, ^, &, *)
- Cannot reuse any of the last 5 passwords
- Cannot contain the user's email address or display name
- Cannot match commonly breached passwords (checked automatically)

Passphrases work well and are easy to remember. Examples: 'Sunshine#River42!', 'Monday\$Coffee2026', 'NextCall@Noon5!'.

Common rejection reasons

- Too short -- must be at least 12 characters
- Missing a character type -- needs all four: uppercase, lowercase, number, special
- Password reuse -- the system remembers the last 5 passwords
- Breached password -- common strings like 'Password123!' are blocked automatically

4. Account Lockout

Accounts are automatically locked after 5 consecutive failed login attempts. This is a security protection that lasts 30 minutes.

- The lockout is per-user, not per-device -- trying from a different browser won't bypass it
- After 30 minutes, the lockout expires and the customer can try again
- The lockout counter resets after a successful login
- The account can be unlocked immediately without waiting the 30 minutes

AGENT PROCESS (internal -- not customer-facing)

Unlock path: Admin Console > Users > Search user > Security tab > Unlock Account.

If locked 3+ times in a week without customer's knowledge, escalate to Security team (possible brute-force).

5. Two-Factor Authentication (MFA)

How MFA works

Two-factor authentication sends a 6-digit verification code via SMS to the phone number on the account. The customer enters this code after their password to log in.

Other supported methods:

- Authenticator app (Google Authenticator, Microsoft Authenticator, Authy) -- generates time-based codes, works without cell signal
- Backup codes -- 8-digit single-use codes generated during MFA setup (10 codes provided). These can be used instead of the SMS code to log in immediately.

If the SMS code isn't arriving

Common reasons:

- The phone number on the account may have changed (customer switched carriers, got a new number)
- Carrier delays -- SMS codes can take 2-3 minutes depending on the carrier
- Phone is in Do Not Disturb mode or SMS is blocked for short codes

If the customer has backup codes from their initial MFA setup, any unused code can be entered instead of the SMS

code to log in right away.

If no backup codes and no SMS access

MFA can be reset so the customer can log in with just their password. If the customer has already been identity-verified during the same session (e.g., for an email update), no additional verification is needed for the MFA reset.

After the reset:

- The customer logs in immediately with their password -- no verification code needed
- On the next login, they're prompted to set up two-factor authentication again
- They can choose SMS or an authenticator app
- A confirmation notification is sent to their email when MFA settings change

MFA setup recommendations

- Authenticator apps are recommended over SMS -- more reliable, works without cell signal
- Save backup codes in a password manager or print them -- they are the emergency safety net
- MFA setup can be skipped temporarily but the system will prompt again at next login

AGENT PROCESS (internal -- not customer-facing)

MFA reset: Admin Console > Users > [User] > Security > Multi-Factor Authentication > Reset MFA.

Enterprise/Scale accounts: requires Tier 2 authorization or supervisor approval.

Logged in Security Audit Trail.

6. Single Sign-On (SSO) Accounts

Some organizations use Single Sign-On (SSO) for Nextiva, where login is managed by the company's identity provider (like Okta, Azure AD, or Google Workspace) instead of Nextiva directly.

SSO users cannot reset their Nextiva password through the Nextiva login page. Instead, they reset their password through their company's SSO portal:

- Okta: mycompany.okta.com > Settings > Change Password
- Azure AD / Entra ID: myaccount.microsoft.com > Security > Password
- Google Workspace: myaccount.google.com > Security > Password

If the Nextiva app tile is missing from the SSO portal, the customer's IT Admin needs to assign the Nextiva app to their user profile.

7. New User Access Issues

New users receive a welcome email with a temporary password and instructions to set a permanent password. The temporary password expires in 72 hours.

- If the welcome email didn't arrive, it may be due to a typo in the email address entered during user creation
- The email can be corrected and the welcome email resent
- For onboarding multiple users at once, CSV bulk import is available (Admin Console > Users > Import)

AGENT PROCESS (internal -- not customer-facing)

Correct email: Admin Console > Users > Search by name > Profile > Edit email > Save.

Resend welcome: Admin Console > Users > [User] > Security > Resend Welcome Email.

8. Quick Reference

- Reset email not received --> Check spam/Promotions tab, verify which email is registered on the account
- No access to registered email --> Verify identity (2 of: card last 4, billing zip, creation date, phone, security question), update email, confirm, then reset

- Reset link expired --> Request a new one; links are valid for 24 hours
- Password rejected --> Must be 12+ characters with uppercase, lowercase, number, and special character
- Account locked --> Can be unlocked immediately; lockout is 30 min after 5 failed attempts
- MFA code not arriving --> Check backup codes first; if none, MFA can be reset after identity verification
- SSO user --> Password is managed by the company's identity provider (Okta/Azure AD/Google), not Nextiva
- New hire can't log in --> Check if email was entered correctly; resend welcome email
